Unlike traditional slots that feature spinning reels and complex paylines, Limbo provides the player with a single, tidy user interface: a target multiplier and a win possibility.

The premise is straightforward:

1. The player puts a wager in their selected cryptocurrency (e.g., Bitcoin, Ethereum, GBPT, or Dogecoin).
2. The player sets a **target multiplier** (e.g., 2x, 10x, 100x, or even 1,000,000 x).
3. The game generates a random multiplier outcome.
4. If the produced multiplier is **greater than or equal to** the target multiplier, the player wins. If it falls short, the bet is lost.

Because the game is hosted on crypto platforms, almost every reputable variation of Limbo is **provably reasonable**. This means gamers can independently validate the cryptographic hash of every round to make sure the gambling establishment did not control the outcome.

How Limbo Works: The Mechanics Behind the Multiplier

To really comprehend Limbo, one should take a look at how the math runs under the hood. The game depends on a home edge, which normally ranges from 1% to 2% depending upon the specific crypto gambling establishment being used.

When a gamer chooses a target multiplier, the game automatically calculates the specific win possibility based upon that multiplier and the house edge.

The Core Equation

Usually, the win opportunity is calculated as:£ £ \ text Win Chance (%) = \ frac 100 - \ text House Edge (%) \ text Target Multiplier £ £

For example, on a platform with a 1% house edge:

- If a gamer sets a target of **2.00 x**, the win possibility is roughly **49.5%**.
- If a player sets a target of **10.00 x**, the win opportunity drops to **9.9%**.
- If a player sets a target of **100.00 x**, the win chance plummets to **0.99%**.
