5. **Money Out or Continue:** After any successful tile expose, the gamer can choose to **Cash Out**, securing their present earnings. Additionally, they can continue clicking for greater rewards.

Game Configurations and Payout Mechanics

The mathematical structure of the Mines game depends on probability and threat management. By modifying the game settings, players fundamentally change the volatility of each round.

Grid Size Number of Mines Threat Level Payment Potential 5x5 (25 tiles) 1 Mine Extremely Low Very little increments per tile 5x5 (25 tiles) 3 Mines Low-Medium Moderate constant development 5x5 (25 tiles) 5 Mines Medium Balanced risk/reward 5x5 (25 tiles) 10 Mines High Rapid multiplier development 5x5 (25 tiles) 20+ Mines Severe Massive payouts on single tiles

As displayed in the table above, increasing the mine density significantly changes the multiplier trajectory. With just one mine on a 5x5 grid, a gamer needs to clear lots of tiles to see a considerable return. Conversely, with 20 mines concealed, discovering even one safe tile yields a substantial multiplier, though the chance of hitting a mine on the very first click is 80%.
