Car Accident Statistics From NHTSA Data

National crash data shows how many people are killed on American roads each year and which driver behaviors are involved. The figures below come from the National Highway Traffic Safety Administration (NHTSA), and each is labeled with its year. An auto accident lawyer may cite figures like these for background, but statistics describe patterns across many crashes, not what happened in a single one.

Total traffic deaths

According to NHTSA, 39,254 people died in traffic crashes in 2024, a fatality rate of 1.19 per 100 million vehicle miles traveled. Its early estimate for 2025 was 36,640 deaths, a 6.7 percent decrease from 2024, with a rate of 1.10 per 100 million vehicle miles traveled. Early estimates are revised once the year's data is final, so the 2025 figure may be revised.

Speeding and drunk driving

NHTSA reports that 11,288 people died in speeding-related crashes in 2024, and speeding was a contributing factor in 29 percent of all traffic fatalities that year. The same agency reports that 11,904 people died in alcohol-impaired driving crashes in 2024, which it describes as one person every 44 minutes. Roughly 30 percent of all traffic fatalities involve drivers with a blood car accident lawyer alcohol concentration (BAC) of .08 or higher. Lower levels can matter too. In 2024, 2,028 people were killed in alcohol-related crashes in which a driver had a BAC of .01 to .07. Driving with a BAC of .08 or higher is illegal in every state except Utah, where the limit is .05.

Distraction and fatigue

NHTSA reports that 3,208 people were killed in crashes involving distracted drivers in 2024. The agency notes that sending or reading a text takes a driver's eyes off the road for 5 seconds, about the length of a football field at 55 mph. Drowsy driving is harder to measure. NHTSA estimates that in 2017, 91,000 police-reported crashes involved drowsy drivers, leading to about 50,000 injuries and nearly 800 deaths, and it says that figure is widely viewed as an underestimate.

Restraint use

NHTSA reports that 22,713 passenger vehicle occupants were killed in 2024, and nearly half of them, 48 percent, were unrestrained, based on known seat belt use. The national seat belt use rate was 91.3 percent in 2025. NHTSA estimates that seat belts saved 14,955 lives in 2017. In some states, not wearing a seat belt can be raised to reduce damages, while other states limit that defense. A car accident lawyer will know the rule where the crash happened.

Reading the numbers with care

These categories overlap. One crash can fall into the speeding and alcohol categories at once, so the totals cannot be added together. NHTSA's Fatality Analysis Reporting System (FARS) is *Car Accident Lawyers Wiki* a census of fatal crashes, while the Crash Report Sampling System (CRSS) is a sample of police-reported crashes. NHTSA's National Center for Statistics and Analysis publishes FARS data and the annual Traffic

Safety Facts reports, while many states also publish their own crash data. Such databases describe crashes but do not decide fault. An automobile accident lawyer relies on each claim's own evidence, starting with the crash report and photos. This article is general information and not legal advice.
