The principle is easy. A gamer sets a target multiplier (e.g., 2.00 x, 10.00 x, or even 1000.00 x). The game's algorithm then creates a random multiplier. If the generated multiplier is **equivalent to or higher** than the player's target, the bet wins. If it fails, the bet is lost.

2. **Pick a Target Multiplier:** The player inputs their preferred winning multiplier. This can vary anywhere from a modest 1.01 x approximately severe values like 1,000,000 x, depending on the gambling establishment's maximum payout limitations.
3. **Inspect the Win Chance:** As the gamer changes the target multiplier, the game interface automatically computes the analytical possibility of winning (Win Chance %) based on the house edge.
4. **Struck "Bet" or "Play":** The round performs quickly. A random number is generated in milliseconds, showing the result on the screen.

In most variations of Limbo, the **home edge** varieties between **1% and 2%**. This means that over the long term, the gambling establishment maintains a little portion of all wagers.

The relationship between the target multiplier and the win opportunity is inversely proportional. As the target multiplier boosts, the win possibility reduces significantly.

Example Limbo Multiplier vs. Win Chance Table (Based on a 1% House Edge)

Target Multiplier Analytical Win Chance Possible Payout on £ 10 Bet **1.05 x** 94.28% £ 10.50 **2.00 x** 49.50% £ 20.00 **5.00 x** 19.80% £ 50.00 **10.00 x** 9.90% £ 100.00 **50.00 x** 1.98% £ 500.00 **100.00 x** 0.99% £ 1,000.00 **1,000.00 x** 0.099% £ 10,000.00

As highlighted in the table, setting a target of 2.00 x offers the player approximately a 50% possibility of doubling their money (minus your house edge), while going after a 1,000.00 x multiplier drops the odds to less than one in a thousand.
