An aggregator acts as a centralized bridge. By integrating a single API (Application Programming Interface) provided by the aggregator, an online casino gains instant access to thousands of games from lots-- in some cases hundreds-- of different designers.

How Does an iGaming Aggregator Work?

At its core, the aggregator operates on an unified API architecture. Here is a breakdown of how the procedure streams in between the gamer, the gambling establishment, the aggregator, and the video game supplier:

1. **Game Selection:** The operator picks which studios and specific titles they want to display on their gambling establishment lobby by means of the aggregator's back-office.
2. **Player Interaction:** A gamer visits the online casino site and clicks on a slot game.
3. **API Request:** The gambling establishment's platform sends out a request to the aggregator.
4. **Content Delivery:** The aggregator fetches the video game information from the particular game company's server and loads it onto the player's internet browser.
5. **Betting & & Settlement:** When the gamer puts a bet, the transaction is processed safely through the aggregator, which communicates the balance updates in between the casino's wallet and the video game company.
